Core Data is great at managing object graphs. Even complex object graphs with many entities and relationships aren't much of a problem for Core Data. However, Core Data does have a few weak spots, updating large numbers of records being one of them. The problem is easy to understand. Whenever you update a record, Core Data loads the record into memory, updates the record, and saves the changes to the persistent store, a SQLite database for example.

Core Data can use SQLite as its persistent store, but the framework itself is not a database. Core Data is not a database. Core Data is a framework for managing an object graph. An object graph is nothing more than a collection of interconnected objects. The framework excels at managing complex object graphs. Core Data manages an object graph.

What Is the Difference Between Core Data and SQLite

Xcode provides the Core Data Stack code you need in the usual location: in the AppDelegate.swift file. There's one notable difference though. Instead of initializing a normal NSPersistentContainer, Xcode uses the new NSPersistentCloudKitContainer (this is why it's important to check the CloudKit box when you create your app).
