The MAF sensor (a potentiometer) senses the quantity of airflow in the engine's air induction system and generates a voltage signal that varies with the amount of air drawn into the engine. The IAT sensor (a sensor in the area of the MAF sensor) measures the temperature of the incoming air and transmits a corresponding electrical signal.

KNOW YOUR ENGINE SENSORS. Sensors monitor all the key functions necessary to manage ignition timing, fuel delivery, emission controls, transmission shifting, cruise control, engine torque reduction (if the vehicle has anti-lock brakes with traction control) and charging output of the alternator. On many late model vehicles (Toyota, Nissan, etc.), the PCM even controls the throttle because there is no direct cable or linkage connection to the throttle.

Engine sensors such as temp sensors and pressure sensors allow a BMW's engine computer (ECU) to receive signals from various systems in your BMW. Faulty engine sensors will result in bad electronic messages that create poor running conditions. Early replacement is recommended to keep your BMW running properly.
